Sinus-lift made easy!

Thursday, 4 May 2023

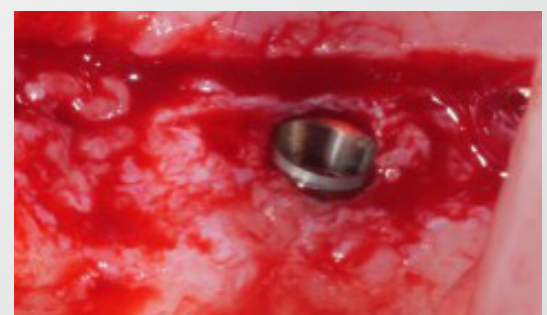

14:00–17:00

Speaker:

**Prof. Andreas
Stavropoulos**

Sinus-lift is a common procedure for producing bone at the posterior maxilla. But is a 3D x-ray always necessary for planing? When is the lateral window approach, instead of the transcrestal technique, indicated? How much remaining bone height is needed for simultaneous implant installation? Should one use rotating instruments or piezo surgery? What to do if the Schneiderian membrane ruptures? What to do if there is a sinus septum? Which type of augmentation material to use – autogenous bone, a bone substitute, or a combination? Or maybe nothing? Is it necessary to close the lateral window with a membrane? How long should one wait for healing, until implant installation in a two stage approach? During this workshop, these and other questions will be discussed and practised on models.
